

Department of Gynaecology & Obstetrics

Profile:

ICAR, New Delhi sanctioned a scheme for the study of Infertility in Cattle at the College of Veterinary Science and AH in 1965. The object of this scheme was to initiate and improve upon teaching and research in Animal Reproduction including Veterinary Obstetrics, Gynaecology and Artificial Insemination. The department of Veterinary Obstetrics and Gynaecology was fully established in 1968. The theoretical and practical training in the fields of applied reproduction and gynaecology are imparted to undergraduate and post-graduate students of Veterinary Science. Under Cattle Infertility Scheme, the department of Obstetrics and Gynaecology had treated more than 1.5 lac cases which include AI and sexual health control cases. The staff members of the department have also participated in more than 150 Gynaecological Camps organized in the state. Total 88 students at M.V.Sc. level and 10 students at Ph.D. level have been trained at this department. A total of 345 research papers and text books on Farm Animal Reproduction have been published so far through this department. The staff members of this department have bagged many awards and laurels, and have also attended large number of Symposia and Conferences of National and International repute.

E. Research Recommendations

Year: 2000-01 (For Scientific Community)

Repeat breeding animals should be flushed using three way (Foley) catheter with broad spectrum antibiotic and mucolytic agent to clear the tubal blockage causing tubal impatency.

Year: 2004-05 (Recommendation for Farmers)

Dairy farmers are advised to breed the bovines by 7th week postpartum to optimize the intercalving period. Animals not observed in oestrus, by this time are required to be examined gynaeco-clinically by veterinarians for inducing estrus and the subsequent breeding.

Year: 2010 (For Scientific Community)

Para-veterinarians and inseminators involved in the breeding activities at the field level should exercise extreme care in location of the external os while performing

inseminations, intra-uterine medications and handling of distocia problems to minimize cervical lacerations leading to distortion of cervix.

Year: 2013-14 (3) (For Scientific Community)

- a. It is recommended that the **true anoestrus** crossbred dairy cows and buffaloes having average body condition under field conditions can be treated/managed by the field veterinarians, using estrus synchronization protocols, viz., (i) intra/vaginal insertion of progesterone releasing device (CIDR/PRID) for 7 days, followed by Inj. PGF₂α, 25 mg, i/m, on day 7, while removing the device and Inj. Busereline acetate (GnRH), 20 mcg, i.m., on day 9 with fixed time double inseminations performed at 0 and 24 hrs later; and (ii) Ovsynch treatment protocol, comprising Inj. Busereline acetate (GnRH), 20 mcg, i/m on day 0; followed by Inj. PGF₂α, 25 mg, i/m, on day 7; and second Inj. GnRH, 10 mcg, i/m, on day 9 followed by fixed time insemination 16-24 hrs later, with nearly cent per cent induction of ovulatory estrus and, 40 to 50 and 70 to 80 per cent conception rates of induced and three post-treatment cycles, respectively.
- b. It is recommended that under field conditions, the **repeating** crossbred cows and buffaloes, having average body condition and no any palpable or visible genital abnormalities, can be treated/managed by the field veterinarians, using mid-cycle Inj. PGF₂α, 25 mg, i/m, to induce ovulatory estrus nearly cent per cent, with 40 to 50, and 70 to 80 per cent conception rates of induced and three post-treatment cycles, respectively.
- c. It is recommended that under field conditions, the **repeating** crossbred cows and buffaloes, having average body condition and no any palpable or visible genital abnormalities, can be treated/managed by the field veterinarians, using Inj. GnRH, 10 mcg, i/m, at the time of AI with an improvement of conception rate up to 30 to 40 per cent at first service and overall up to 60 to 70 per cent.

Year: 2015-16 (2) (For Scientific Community)

1. "Inclusion of taurine @ 4 mg/ml or cysteine @ 1 mg/ml in standard Tris Fructose Yolk Glycerol (TFYG) extender is recommended to the semen banks as a routine suitable antioxidant additive for improved cryopreservation and/or refrigeration preservation of buffalo semen as it significantly (P<0.01) enhanced sperm progressive motility, viability, and membrane integrity with reduced sperm/acrosome abnormalities at all stages of refrigeration preservation as well as cryopreservation of buffalo semen when compared with control TFYG extender and other levels of additives (0.5 mg/ml cysteine and 6 mg/ml taurine)".
2. "Three estrus/ovulation synchronization protocols, viz., Ovsynch, Heatsynch and Triu-B used in true anoestrus crossbred cows resulted into equally good estrus induction response (80-100%) and conception rates (45-58%) in both winter and summer seasons. In anoestrus buffaloes, both estrus induction response and conception rates were better during winter (83-92% and 50-58%) than in summer (73-84% and 21-33%) season, suggesting better scope for their use in cows round the year and in buffaloes only during winter season".
